

G-O DIFFUSERS

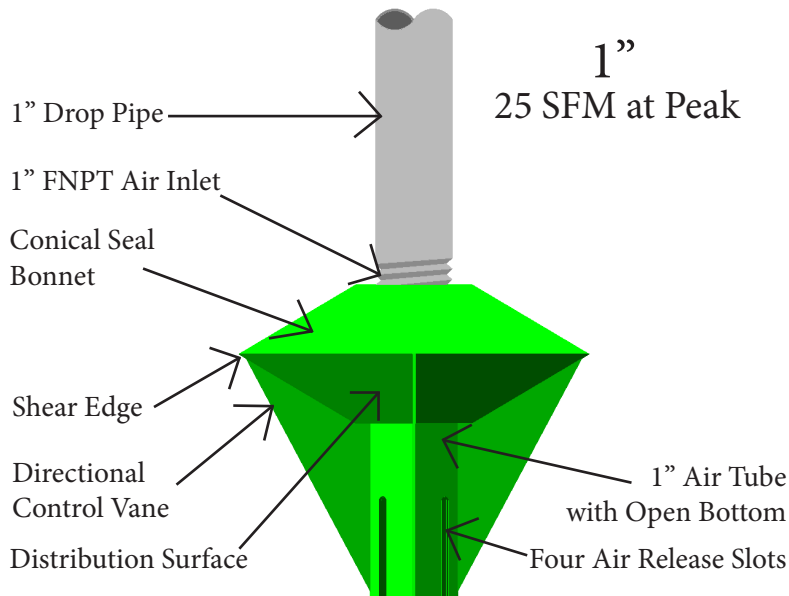

More than 30,000 installed over the last 30 years

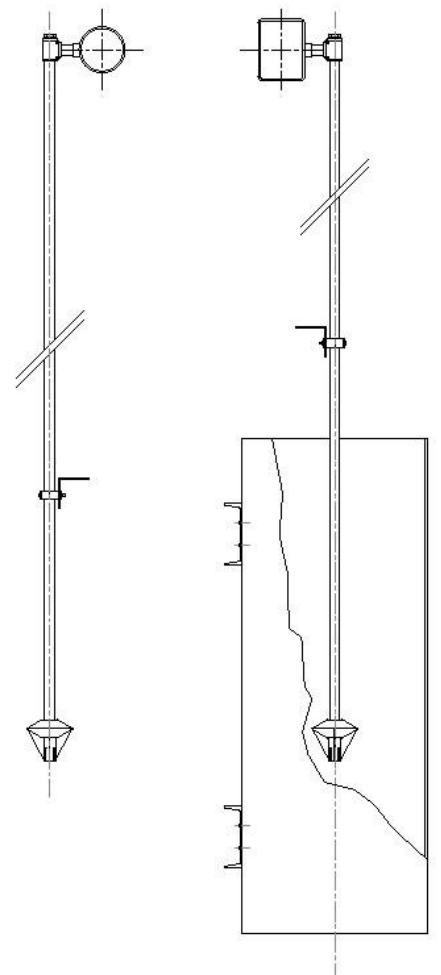

The G-O Diffuser is a single-drop medium bubble aeration diffuser that is truly no-clog, maintenance free and continuously efficient. With no orificing below the water surface clogging is eliminated due to the free flow of air through the drop pipe. Providing superior tank mixing with lower air flows required.

The one piece unit is molded of high strength ABS that resists heat to over 200°F. The diffuser's air release slots and shear edge provide consistent bubble size, meaning no loss of efficiency over operation time due to bubble formation over this shear edge. Directional control vanes and the conical top seal bonnet prevent bubble coalesce. These unique features translate into the most efficient single drop medium bubble diffuser on the market.

Shear tubes and draft tubes in combination with the G-O Diffuser can provide excellent mixing and efficient aeration of deeper basins while maintaining lower blower pressure requirements. The G-O Diffuser is particularly suitable for grit basins, digesters and other high solids application.
